HNC Virtual Solutions is a telehealth software solutions company that offers a complete system for health care professionals. VideoDoc® is our HIPAA and HITECH compliant telehealth platform that offers extensive video engagement options and utilizes our patented remote patient monitoring technology to capture, secure, and retrieve information on patient physiologies.

Our primary objective is to redefine the way in which care is delivered by providing and developing software and technology solutions that integrate with FDA Class II biometric devices as well as pioneering new video conferencing technologies to reduce user roadblocks. These innovations facilitate patient-doctor interactions outside of the confines of the traditional facility care delivery model. We cover popular telehealth use-cases, which include Video Engagement, Remote Patient Monitoring, Cart / Kiosk, and have white labeling options for all of our solutions. Our latest software version offers tools to evaluate Social Determinates of Health and include Behavioral Health assessments and tracking.

Our mission has always been to deliver easy to use technology that empowers patients and healthcare professionals to collaborate on the management of health, while increasing the efficiency and availability of healthcare. We are excited to show you how we continue to accomplish this mission with our latest technology.

Key Use Cases

VideoDoc® Consumer Model – On-demand Virtual Consultations

Our Consumer Model, featuring the VideoDoc® platform, focuses on an on-demand virtual consultation with a doctor via the patient's mobile phone.

The VideoDoc® virtual visit platform allows providers to conduct more consultations and assessments quickly and more efficiently while also keeping clinicians and patients safe by eliminating unnecessary face-to-face visits. The platform enables seamless virtual visits using a highly streamlined user interface and provides patients with a one-click entry to virtual sessions. Clinicians gain access to a complete reporting system to support all billing needs and requirements. This solution is tailored for:

- Urgent Cares
- Small & Large Physician Systems
- Conducting Patient Assessments
- Virtual Follow-up Visits
- Common Condition Monitoring

Remote Patient Monitoring

HNC's Remote Patient Monitoring platform enables streamlined, intuitive case management with integrated web-based video, vital threshold monitoring, and health surveys. This supports remote communication between a patient and a healthcare professional that is used to monitor chronic disease patients. Patients remotely upload their vitals for real-time review by their healthcare professionals. Vital information, such as blood pressure, blood glucose, and weight is encrypted and securely transmitted using military grade encryption, and transported to our HIPAA-compliant portal for review by healthcare professionals from any web capable device. Our solution is ideally suited to supporting common use cases including:

- Chronic Care Management
- Chronic Disease Management
- High-risk Surveillance
- Home Health
- Post-Discharge/Post-Surgery Surveillance

Kiosk – Virtual Clinic Anywhere

Our Kiosk solution is a branch from our Remote Patient Monitoring Program that allows the software to be deployed to a mobile kit or a Telehealth cart and to be utilized for multiple patients rather than just one patient. The Kiosk uses wireless FDA-certified medical peripherals and can employ other specialized devices such as a PTZ camera for TeleStroke / Tele-Psych, microscopic camera with ENT attachments, 12-Lead ECG, and more. This system is useful for making better use of physician's time via virtual rounding or having less specialized staff administer vitals and coordinate a virtual doctor visit when travelling house to house for at-home visits. This system is especially beneficial for:

- Community Health
- Rural Health
- Nursing Homes
- Assisted Living
- Urgent Care Facilities
- Triage Centers
- Rural ER Management
